

Local Market Signal Tracker

The area-level shifts that move demand — not about any one competitor, about the market underneath all of you.

Competitor tracking tells you how you compare to rivals. This tracks the market itself — the signals that shift demand for everyone in your area, which a purely competitor-focused view can miss entirely.

What to watch

- [] New developments or major planning applications in your area — check your local council's planning portal periodically
- [] Seasonal search pattern shifts — use Google Trends for "[your town] houses for sale" or similar, and note when demand typically rises or falls
- [] Local price trend direction — Rightmove and Zoopla both publish area price trend data
- [] Local employer or transport changes — a major employer opening, closing, or a new transport link can shift an area's desirability quickly
- [] Rental yield or demand shifts, if you handle lettings — watch void periods and how fast properties are letting compared to a few months ago

These signals move slower than competitor activity but tend to matter more — a shifting market changes what every agent in the area is dealing with, competitor or not.
